Financial Interview Questions And Answers Guide.

Question - 1:

Describe biggest opportunities and the biggest challenges that financial professionals face in today's market?

Ans:

Interviewer expects you understand the current economic times, the financial sectors issues relating to reputation issues, regulatory changes, cost reduction, industry innovations, and credit availability. If you want to increase your likelihood of getting the position, give this question the attention it deserves.

[View All Answers](#)

Question - 2:

How you persuade others to see your point of view?

Ans:

In the finance industry financial professionals often have to persuade influential people to count on their expertise, follow their advice, and use their services. Your interviewer will want to make sure you are able to determine the best approach to achieve what you want by influencing clients.

[View All Answers](#)

Question - 3:

Tell me what you can do to add value to our organization?

Ans:

Your answer to this question needs to highlight your knowledge of the company, that you understand the company's goals, achievements, and the challenges it faces.

[View All Answers](#)

Question - 4:

Which high stress situation you found in yourself and how did you handle it?

Ans:

The finance industry is always under pressure and the interviewer is looking to see if you are able to perform under pressure, that you can stay calm, and defuse a stressful situation.

[View All Answers](#)

Question - 5:

Give me a good example of a recent win-win situation you successfully negotiated?

Ans:

Think carefully before you answer, because the object of this question is to explore whether you are capable of communication information and whether you have the ability to communicate in a way that will gain the acceptance and agreement you are seeking.

[View All Answers](#)

Question - 6:

Describe how you approach teamwork and what your plan would be to adapt so you could effectively work with the team?

Ans:

Finance interviewers are looking for team players who can build strong relationships and play an integral role in the team's success. In the financial industry it's imperative that you can successfully work in a team environment, and that you are highly adaptable.

Question - 7:

What is your major achievement in your career?

Ans:

Choose one of your most notable achievements and why you felt it was important.

Keep it relevant to the finance position you are applying for. Discuss the challenges you faced and tell the interviewer how your achievement can help you succeed in your new position.

[View All Answers](#)

Question - 8:

Tell me what do you feel motivates you?

Ans:

When an interview question about your motivation is asked it's designed to determine whether you have the right motivation to be a good fit for the company and the position offered.

Make sure you make you describe your motivation in manner that's relevant to the job.

[View All Answers](#)

Question - 9:

Say you are driving on a one-mile track. You do one lap at 30 miles an hour. How fast do you have to go to average 60 miles an hour?

Ans:

This is something of a trick question, and was recently received by a Goldman candidate. The first thought of many people is to say 90 miles an hour, but consider: If you have done a lap at 30 miles an hour, you have already taken two minutes. Two minutes is the total amount of time you would have to take in order to average 60 miles an hour. Therefore, you can not average 60 miles an hour over the two laps.

Question - 10:

If I were to fill this room with pennies, how many pennies would fit in?

Ans:

A literally in-your-face guesstimate.

[View All Answers](#)

Question - 11:

Tell me a good joke that is neither sexist nor racist.

Ans:

If you can't think of any, you're in the same boat as the unfortunately tongue-tied recent candidate at Salomon Smith Barney. Find one and remember it.

[View All Answers](#)

Question - 12:

If you have seven white socks and nine black socks in a drawer, how many do you have to pull out blindly in order to ensure that you have a matching pair?

Ans:

Three. Let's see - if the first one is one color, and the second one is the other color, the third one, no matter what the color, will make a matching pair. Sometimes you're not supposed to think that hard.

[View All Answers](#)

Question - 13:

A straight flush beats a four-of-a-kind in poker because it is more unlikely. But think about how many straight flushes there are - if you don't count wraparound straights, you can have a straight flush starting on any card from two to 10 in any suit (nine per suit). That means there are 36 straight flushes possible. But how many four of a kinds are there - only 13. What's wrong with this reasoning?

Ans:

Immediately, you should think about what the difference is between a straight flush and a four-of-a-kind. One involves five cards, and the other involves four. Intuitively, that's what should strike you as the problem with the line of reasoning. Look closer and you'll see what that means: for every four of a kind, there are actually a whole bunch of five-card hands: 48 (52 - 4) in fact. There are actually 624 (48 x 13) of them in all.

[View All Answers](#)

Question - 14:

You're playing three-card monte. Two cards are red, one is black. (Note: In three-card monte, the three cards are face down and you try to pick the black card in order to win.) You pick the middle card. After you pick, the dealer shows that one of the cards you have not chosen is red. You are given the chance to switch your selection. Should you?

Ans:

The short answer is yes. By switching, you are betting that the card you initially chose was red. By not switching, you are betting that the card you initially chose was black. And because two out of three cards are red, of course, betting on red is the way to go.

Let's break it down, starting with the not switching case. Say the first card you chose was the black one. This happens one-third of the time. If you do not switch your choice, you win. Needless to say, the other two-thirds of the time, having picked a red card, and deciding not to switch, you lose. In other words, if you do not switch, you win a third of the time.

Now let's examine what happens when you switch cards. Say the first card you chose was the black one. Again, this would happen one-third of the time. If, after being shown a red card, you switch, you lose. The other two-thirds of the time, if you switch, you win because the dealer has already shown you that one of the cards you did not pick is red. Given the premise that your original pick was a red card, the card you are switching to must be the black one. You will win two-thirds of the time.

Question - 15:

You have a painting that is \$320 that is selling for 20 percent off. How much is the discounted price?

Ans:

Calculate quickly: What's 80 percent of \$320? The answer's \$256. Even in a question like this, if you are good with numbers and use shortcuts, don't be afraid to talk aloud. For example: 80 percent of \$320 can be broken down to a calculation like 80 percent of \$80 x \$4, or 162.

[View All Answers](#)

Question - 16:

What is the sum of the numbers from one to 50?

Ans:

Another question that recent analyst hires often report receiving. This is a relatively easy one: pair up the numbers into groups of 51 ($1 + 50 = 51$; $2 + 49 = 51$; etc.). Twenty-five pairs of 51 equals 1275.

[View All Answers](#)

Question - 17:

What is the decimal equivalent of $3/16$ and $7/16$?

Ans:

A commonly-used Wall Street interview question, this one isn't just an attempt to stress you out or see how quick your mind works. This question also has practical banking applications. Stocks often are traded at prices reported in $1/16$ s of a dollar. (Each $1/16 = .0625$, so $3/16 = .1875$ and $7/16 = .4375$).

Question - 18:

The four members of U2 (Bono, the Edge, Larry and Adam) need to get across a narrow bridge to play a concert. Since it's dark, a flashlight is required to cross, but the band has only one flashlight, and only two people can cross the bridge at a time. (This is not to say, of course, that if one of the members of the band has crossed the bridge, he can't come back by himself with the flashlight.) Adam takes only a minute to get across, Larry takes two minutes, the Edge takes five minutes, and slowpoke Bono takes 10 minutes. A pair can only go as fast as the slowest member. They have 17 minutes to get across. How should they do it?

Ans:

The key to attacking this question is to understand that Bono and the Edge are major liabilities and must be grouped together. In other words, if you sent them across separately, you'd already be using 15 minutes. This won't do. What does this mean? That Bono and the Edge must go across together. But they can not be the first pair (or one of them will have to transport the flashlight back).

Instead, you send Larry and Adam over first, taking two minutes. Adam comes back, taking another minute, for a total of three minutes. Bono and the Edge then go over, taking 10 minutes, and bringing the total to 13. Larry comes back, taking another two minutes, for a total of 15. Adam and Larry go back over, bringing the total time to 17 minutes.

Question - 19:

A company has 10 machines that produce gold coins. One of the machines is producing coins that are a gram light. How do you tell which machine is making the defective coins with only one weighing?

Ans:

Think this through - clearly, every machine will have to produce a sample coin or coins, and you must weigh all these coins together. How can you somehow indicate which coins came from which machine? The best way to do it is to have every machine crank a different number of coins, so that machine 1 will make one coin, machine 2 will make two coins, and so on. Take all the coins, weigh them together, and consider their weight against the total theoretical weight. If you're four grams short, for example, you'll know that machine 4 is defective.

Question - 20:

You have 12 balls. All of them are identical except one, which is either heavier or lighter than the rest. The odd ball is either hollow while the rest are solid, or solid while the rest are hollow. You have a scale, and are permitted three weighings. Can you identify the odd ball, and determine whether it is hollow or solid?

Ans:

This is a pretty complex question, and there are actually multiple solutions. First, we'll examine what thought processes an interviewer is looking for, and then we'll discuss one solution.

Start with the simplest of observations. The number of balls you weigh against each other must be equal. Yeah, it's obvious, but why? Because if you weigh, say three balls against five, you are not receiving any information. In a problem like this, you are trying to receive as much information as possible with each weighing.

For example, one of the first mistakes people make when examining this problem is that they believe the first weighing should involve all of the balls (six against six). This weighing involves all of the balls, but what type of information does this give you? It actually gives you no new information. You already know that one of the sides will be heavier than the other, and by weighing six against six, you will simply confirm this knowledge. Still, you want to gain information about as many balls as possible (so weighing one against one is obviously not a good idea). Thus the best first weighing is four against four.

Question - 21:

Why are manhole covers round?

Ans:

The classic brainteaser, straight to you via Microsoft (the originator). Even though this question has been around for years, interviewees still encounter it.

Here's how to "solve" this brainteaser. Remember to speak and reason out loud while solving this brainteaser!

Why are manhole covers round? Could there be a structural reason? Why aren't manhole covers square? It would make it harder to fit with a cover. You'd have to rotate it exactly the right way. So many manhole covers are round because they don't need to be rotated. There are no corners to deal with. Also, a round manhole cover won't fall into a hole because it was rotated the wrong way, so it's safer.

Looking at this, it seems corners are a problem. You can't cut yourself on a round manhole cover. And because it's round, it can be more easily transported. One person can roll it.

Question - 22:

How would you estimate the weight of the Chrysler building?

Ans:

This is a process guesstimate - the interviewer wants to know if you know what questions to ask. First, you would find out the dimensions of the building (height, weight, depth). This will allow you to determine the volume of the building. Does it taper at the top? (Yes.) Then, you need to estimate the composition of the Chrysler building. Is it mostly steel? Concrete? How much would those components weigh per square inch? Remember the extra step - find out whether you're considering the building totally empty or with office furniture, people, etc.? (If you're including the contents, you might have to add 20 percent or so to the building's weight.)

Question - 23:

How many square feet of pizza are eaten in the United States each month?

Ans:

Take your figure of 300 million people in America. How many people eat pizza? Let's say 200 million. Now let's say the average pizza-eating person eats pizza twice a month, and eats two slices at a time. That's four slices a month. If the average slice of pizza is perhaps six inches at the base and 10 inches long, then the slice is 30 square inches of pizza. So four pizza slices would be 120 square inches. Therefore, there are a billion square feet of pizza eaten every month.

To summarize:

300 million people in America

200 million eat pizza

Average slice of pizza is six inches at the base and 10 inches long = 30 square inches (height x half the base)

Average American eats four slices of pizza a month

Four pieces x 30 square inches = 120 square inches (one square foot is 144 inches), so let's assume one square foot per person

200 million square feet a month

Question - 24:

What is the size of the market for disposable diapers in China?

Ans:

Be the first to post your answer here with us.

[View All Answers](#)

Question - 25:

How many gallons of white house paint are sold in the U.S. every year?

Ans:

THE "START BIG" APPROACH: If you're not sure where to begin, start with the basic assumption that there are 270 million people in the U.S. (or 25 million businesses, depending on the question). If there are 270 million people in the United States, perhaps half of them live in houses (or 135 million people). The average family size is about three people, so there would be 45 million houses in the United States. Let's add another 10 percent to that for second houses and houses used for other purposes besides residential. So there are about 50 million houses.

If houses are painted every 10 years, on average (notice how we deftly make that number easy to work with), then there are 5 million houses painted every year. Assuming that one gallon of paint covers 100 square feet of wall, and that the average house has 2,000 square feet of wall to cover, then each house needs 20 gallons of paint. So 100 million gallons of paint are sold per year (5 million houses x 20 gallons). (Note: If you want to be fancy, you can ask your interviewer whether you should include inner walls as well!) If 80 percent of all houses are white, then 80 million gallons of white house paint are sold each year. (Don't forget that last step!)

[View All Answers](#)

Question - 26:

You are faced with two doors. One door leads to your job offer (that's the one you want!), and the other leads to the exit. In front of each door is a guard. One guard always tells the truth. The other always lies. You can ask one question to decide which door is the correct one. What will you ask?

Ans:

The way to logically attack this question is to ask how you can construct a question that provides the same answer (either a true statement or a lie), no matter who you ask.

There are two simple answers. Ask a guard: "If I were to ask you if this door were the correct one, what would you say?" The truthful consultant would answer yes (if it's the correct one), or no (if it's not). Now take the lying consultant. If you asked the liar if the correct door is the right way, he would answer no. But if you ask him: "If I were to ask you if this door were the correct one, what would you say," he would be forced to lie about how he would answer, and say yes. Alternately, ask a guard: "If I were to ask the other guard which way is correct, what would he say?" Here, the truthful guard would tell you the wrong way (because he is truthfully reporting what the liar would say), while the lying guard would also tell you the wrong way (because he is lying about what the truthful guard would say).

If you want to think of this question more mathematically, think of lying as represented by -1, and telling the truth as represented by +1. The first solution provides you with a consistently truthful answer because $(-1)(-1) = 1$, while $(1)(1) = 1$. The second solution provides you with a consistently false answer because $(1)(-1) = -1$, and $(-1)(1) = -1$.

[View All Answers](#)

Question - 27:

You have a five-gallon jug and a three-gallon jug. You must obtain exactly four gallons of water. How will you do it?

Ans:

You should find this brainteaser fairly simple. If you were to think out loud, you might begin by examining the ways in which combination of five and three can come up to be four. For example: $(5 - 3) + (5 - 3) = 4$. This path does not actually lead to the right answer, but it is a fruitful way to begin thinking about the question. Here's

the solution: fill the three-gallon jug with water and pour it into the five-gallon jug. Repeat. Because you can only put two more gallons into the five-gallon jug, one gallon will be left over in the three-gallon jug. Empty out the five-gallon jug and pour in the one gallon. Now just fill the three-gallon jug again and pour it into the five-gallon jug. Ta-da. (Mathematically, this can be represented $3 + 3 - 5 + 3 = 4$)

[View All Answers](#)

Question - 28:

If you look at a clock and the time is 3:15, what is the angle between the hour and the minute hands?

Ans:

The answer to this is not zero! The hour hand, remember, moves as well. The hour hand moves a quarter of the way between three and four, so it moves a quarter of a twelfth ($1/48$) of 360 degrees. So the answer is seven and a half degrees, to be exact.
